

SCD1 Design approach:

This is one of the most widely used design approach.

SRC->SQ->LKP->EXP->RTR->UPD->TGT1 & TGT2

Understanding the Mapping: The Type 1 Dimension mapping performs the following tasks:

1. Selects all rows.
2. Caches the existing target as a lookup table.
3. Compares logical key columns in the source against corresponding columns in the target lookup table.
4. Compares source columns against corresponding target columns if key columns match.
5. Flags new rows as INSERT, changed rows as UPDATE and unchanged incoming rows as REJECT
6. Creates two data flows: one for new rows, one for changed rows.
7. Generates a primary key/surrogate key for new rows.
8. Inserts new rows to the target.
9. Updates changed rows in the target, overwriting existing rows.

Lookup: Lookup on Target table. Pass the natural key from source to Lookup which can be used for condition between Source and Lookup. Get all the TYPE2 attributes from Lookup table.

Help

Expression: Derive Flag which can mark incoming records as either INSERT or UPDATE or REJECT.

To understand if there is any incoming data which there in the target are already and if these incoming data are actual updates which means they are different from target data. MD5 provides a hash number, hence is used for combination of source attributes and target attributes and then compare source attributes with target attributes to understand if there is any actual change.
